

Rank order $\int \mathbf{J} \cdot d\mathbf{A}$ (over blue surfaces) where \mathbf{J} is uniform, going left to right:

- A. $\text{iii} > \text{iv} > \text{ii} > \text{i}$
- B. $\text{iii} > \text{i} > \text{ii} > \text{iv}$
- C. $\text{i} > \text{ii} > \text{iii} > \text{iv}$
- D. Something else!!
- E. Not enough info given!!

Much like Gauss's Law, Ampere's Law is always true (for magnetostatics), but only useful when there's sufficient symmetry to "pull \mathbf{B} out" of the integral.

So we need to build an argument for what \mathbf{B} looks like and what it can depend on.

For the case of an infinitely long wire, can \mathbf{B} point radially (i.e., in the \hat{s} direction)?

- A. Yes
- B. No
- C. ???

Continuing to build an argument for what \mathbf{B} looks like and what it can depend on.

For the case of an infinitely long wire, can \mathbf{B} depend on z or ϕ ?

A. Yes

B. No

C. ???

Finalizing the argument for what \mathbf{B} looks like
and what it can depend on.

For the case of an infinitely long wire, can \mathbf{B}
have a \hat{z} component?

A. Yes

B. No

C. ???

For the infinite wire, we argued that $\mathbf{B}(\mathbf{r}) = B(s)\hat{\phi}$. For the case of an infinitely long **thick** wire of radius a , is this functional form still correct? Inside and outside the wire?

- A. Yes
- B. Only inside the wire ($s < a$)
- C. Only outside the wire ($s > a$)
- D. No

Consider the B-field a distance z from a current sheet (flowing in the $+x$ -direction) in the $z = 0$ plane. The B-field has:

- A. y -component only
- B. z -component only
- C. y and z -components
- D. x , y , and z -components
- E. Other

An infinite solenoid with surface current density K is oriented along the z -axis. To use Ampere's Law, we need to argue what we think $\mathbf{B}(\mathbf{r})$ depends on and which way it points.

For this solenoid, $\mathbf{B}(\mathbf{r}) =$

A. $B(z) \hat{z}$

B. $B(z) \hat{\phi}$

C. $B(s) \hat{z}$

D. $B(s) \hat{\phi}$

E. Something else?

An infinite solenoid with surface current density K is oriented along the z -axis. Apply Ampere's Law to the rectangular imaginary loop in the yz plane shown. What does this tell you about B_z , the z -component of the B-field outside the solenoid?

- A. B_z is constant outside
- B. B_z is zero outside
- C. B_z is not constant outside
- D. It tells you nothing about B_z

An infinite solenoid with surface current density K is oriented along the z -axis. Apply Ampere's Law to the rectangular imaginary loop in the yz plane shown. We can safely assume that $B(s \rightarrow \infty) = 0$. What does this tell you about the B-field outside the solenoid?

- A. $|\mathbf{B}|$ is a small non-zero constant outside
- B. $|\mathbf{B}|$ is zero outside
- C. $|\mathbf{B}|$ is not constant outside
- D. We still don't know anything about $|\mathbf{B}|$

What do we expect $\mathbf{B}(\mathbf{r})$ to look like for the infinite sheet of current shown below?

- A. $B(x)\hat{x}$
- B. $B(z)\hat{x}$
- C. $B(x)\hat{z}$
- D. $B(z)\hat{z}$
- E. Something else

Which Amperian loop are useful to learn about $B(x, y, z)$ somewhere?

E. More than 1
